Design: This experiment assesses whether Americans' perceptions of the major political parties' social composition affects their identification with one party or the other. To do so, we exploit the fact that Americans tend to have systematically inaccurate perceptions about how the parties are composed. In particular, people tend believe that the parties are made up of party-stereotypical group members much more than they actually are. By randomly correcting these misperceptions for some participants but not others, we can get causal leverage on the question.

We propose randomizing participants to one of three conditions. In the ask condition, participants will report beliefs about the share of three party-stereotypical in their in-party before responding to dependent variables pertaining to partisan identification. In the tell condition, respondents will once again report the share of the three groups in their party, but will receive correct answers before responding to the dependent variables. Finally, in the control condition, respondents will answer the dependent measures before responding to any of the party composition items. This is shown in greater detail in what follows.

We propose blocking conditions by party identification (from the previously-measured profile variable) so that there are roughly equal numbers of Republicans and Democrats in each condition. As we describe below, we propose sampling only "weak" and "leaning" partisans to preclude floor and ceiling effects.

Our survey logic also depends on party ID. We propose asking Democrats their beliefs about the percentage of co-partisans who are non-white, atheist or agnostic, and "millennials" (between the ages of 18 and 34). We want to ask Republicans about their beliefs about the percentage of co-partisans who are wealthy (earning $250K or more per year), evangelical, and residing in rural areas. For dependent measures, we plan to ask the standard branched partisanship question, as well as an expressive partisanship battery.

Sample: n = 2100 (~700 per condition), with 9 items in the "Ask" and "Control" conditions and 10 in the "Tell" condition, for a total of 19,600 respondent-items.

We request fielding this experiment only among weak partisans and partisan leaners (respondents who self-placed at 2, 3, 5, or 6 on the a 7-point party identification scale in the panel file). We do so for three reasons. First, party identification is often called the "unmoved mover." W expect effects to be small and are concerned about adequate power to detect these small but theoretically meaningful changes—and respondents who place themselves at "1" or "7," or "4," face potential ceiling and floor effects. Second, strong partisans, who often have more policy-based reasons to identify with the party and are more likely to reason in a motivated manner, are especially unlikely to move. Finally, we expect the largest effects among those who feel somewhat ambiguous about the parties.

SURVEY FLOW

If respondent's partisanship in the NORC panel is 2 or 3 (i.e., weak or leaning Democrat), then branch: RANDOM ASSIGNMENT (WITH EQUAL PROBABILITY)

ASK condition	TELL condition	CONTROL condition
ITEM 1_D	ITEM 1_D	ITEM 4
ITEM 4	ITEM 2_D	ITEM 5
ITEM 5	ITEM 3_D	ITEM 6
ITEM 6	ITEM 4	ITEM 1_D
	ITEM 5	
	ITEM 6	

If respondent's partisanship in the NORC panel is 5 or 6 (i.e., leaning or weak Republican), then branch: RANDOM ASSIGNMENT (WITH EQUAL PROBABILITY)

ASK condition	TELL condition	CONTROL condition
ITEM 1_R	ITEM 1_R	ITEM 4
ITEM 4	ITEM 2_R	ITEM 5
ITEM 5	ITEM 3_R	ITEM 6
ITEM 6	ITEM 4	ITEM 1_R
	ITEM 5
